LS,

I've been following the EV space closely for over a decade. When I recently started my job hunt, Ionity caught my attention; few teams are building infrastructure at this scale and ambition.

The IT PO role maps well to what I've been doing. At South Pole I've owned multiple SaaS products through full cycles: backlog management, story slicing, coordinating across technical and business stakeholders, defining acceptance criteria, navigating dependencies. I delivered an MVP in 6 months with full UX and user-testing cycles, and launched a no-code double-materiality assessment tool in 4 months. I've worked in agile environments throughout, and while my SAFe exposure is more at the conceptual than ceremonial level, the underlying discipline - incremental delivery, cross-team alignment, keeping quality upstream - is very familiar ground.

I see climate change as the most urgent crisis humanity is currently facing, and I've spent the better part of a decade fighting it professionally, first building CO_2ok from scratch, then shaping climate products at South Pole. I'd love to keep doing that work, and contributing to the backbone of EV charging in Europe seems like a worthy next chapter.

I look forward to expanding on this in an interview.

Regards,
Milo de Vries
