LS,

Project Bonsai caught my eye while browsing JetBrains' openings. The problem you're working on - connecting specs, architecture and code in a way that AI agents can actually reason about - is exactly the kind of deep, structural challenge I find compelling.

My background sits at the intersection of product and technical work. At South Pole I took multiple SaaS products from concept to launch, led discovery cycles, ran UX testing, and made the call on what to build and what to kill. Before that, I founded CO_2ok from scratch: defined the product, built the team, secured funding, onboarded merchants, and eventually negotiated an exit. I know what zero-to-one looks like, and I know how to move through the ambiguity that comes with it.

The developer tooling angle is new territory for me, but I've spent years working closely with engineers, reasoning about systems, and translating technical constraints into product decisions. I can hold my own in technical conversations; I've worked with AI/ML integrations, cloud architecture, and APIs throughout my career.

What draws me to Bonsai specifically is that it's a genuinely hard problem with a prototype already in hand. The scope is still being shaped - that's the part I want to be involved in.

I look forward to expanding on this in an interview.

Regards,
Milo de Vries
