LS,

Overstory caught my attention immediately: satellite imagery and ML to prevent wildfires and protect the grid sits right at the intersection of things I care about and have actually worked on.

At South Pole I led product and technical strategy across several AI-assisted climate tools, from a product carbon footprinting prototype to a forest-impact calculator using satellite imagery and ML. I know what it takes to take a complex, data-heavy product from PoC to enterprise clients; I also know how to make honest calls about what the AI can and can't do. Before that, I founded and scaled CO_2ok from zero to acquisition, which means I've lived the Series A chaos and know what it costs to build something real under pressure.

The CTO role here is essentially that same journey, one level up: turning technical ambiguity into a strategy that a global team can execute on, while staying close enough to the product to make the right calls. That balance is something I've been building toward.

Ultimately, using technology to reduce wildfire risk and keep the grid resilient is exactly the kind of fight I want to be in.

I look forward to expanding on this in an interview.

Regards,
Milo de Vries
