LS,

The energy transition is something I've been invested in for years, and envelio's work on grid intelligence and renewable integration caught my attention immediately. A B2B SaaS product tackling one of the hardest infrastructure challenges of our time; that's exactly the kind of problem I want to work on.

At South Pole I've taken multiple SaaS products from concept to launch, including climate risk and CSRD tooling serving 30+ enterprise clients. I'm used to the regulated, stakeholder-heavy environment that comes with enterprise climate products: managing expectations across consultants, engineers and leadership, writing clear requirements, and keeping roadmaps grounded in real user needs rather than assumptions.

Before that, I founded CO_2ok, a climate-tech startup I grew from zero to acquisition. That shaped how I think about product: ruthlessly prioritize, stay close to the user, and make decisions with data.

I won't pretend I'm a power grid engineer. But I do understand complex B2B markets, cross-functional agile teams, and how to break down technical domains quickly and turn them into product that ships.

Ultimately, fighting climate change professionally is what drives me, and grid digitalization is where a lot of that fight is happening right now.

I look forward to expanding on this in an interview.

Regards,
Milo de Vries
